

1. How Does the Web Work?

The web (World Wide Web) works through a communication system between clients and servers using the Internet.

Step-by-Step:

1. You enter a website address (like www.example.com) in your browser.
2. The browser sends a request to a web server using the HTTP/HTTPS protocol.
3. The server receives the request, processes it (sometimes using backend code like Django, Node.js, etc.), and sends back a response — usually an HTML, CSS, and JavaScript file.
4. The browser interprets these files and displays the webpage to you.

In summary:

Browser requests → Server responds → Browser displays webpage

2. What Do You Need to Be a Web Developer?

To become a web developer, you need a combination of technical skills and tools and some managerial skills.

Essential Skills:

Frontend (what users see):

- HTML – structure of a webpage
- CSS – styling and design
- JavaScript – interactivity and logic
- Frameworks like React, Next.js, or Vue.js (optional but powerful)

Backend (what happens behind the scenes):

- A server language like Python (Django), Node.js, PHP, or Java
- Databases – MySQL, PostgreSQL, or MongoDB
- APIs – to connect frontend and backend

Other Important Skills:

- Version control (Git & GitHub)
- Basic web hosting and deployment
- Problem-solving and debugging

3. Why Did You Choose to Learn Web Development?

I chose to learn web development because it allows me to create things that people can actually use. The idea of building websites and applications that solve real problems or help businesses grow excites me.

It also combines creativity and logic — I enjoy designing how things look while also making them function properly.

Plus, web development offers endless learning opportunities and a strong global career path since almost every organization needs a web presence.
